

Customized UI re-design

≡ Customer	Client A in E-commerce industry
≡ Done by	low conversion rate due to user unfriendly UI

Customized UI re-design

Client is one of the major commerce company which both broadcasts the products and also expose them into mobile application. While the customers are changing their purchase medium from TV to mobile, client's mobile application revenue was rapidly decreasing. Therefore, after analysis of application we have found out that the UI of application was bad so even I was disturbed to buy the product. Therefore, we suggested that we have to revisit the whole UI for the application based on the analysis of customer data. During the project we have coworked with client's web designer and developers.

The mode of work was

1. segmenting and analysis based on customer data (My team)
2. suggesting sample of UI and rationale(My team)
3. discuss the suggested idea and evaluate the attractiveness & feasibility with my team and client

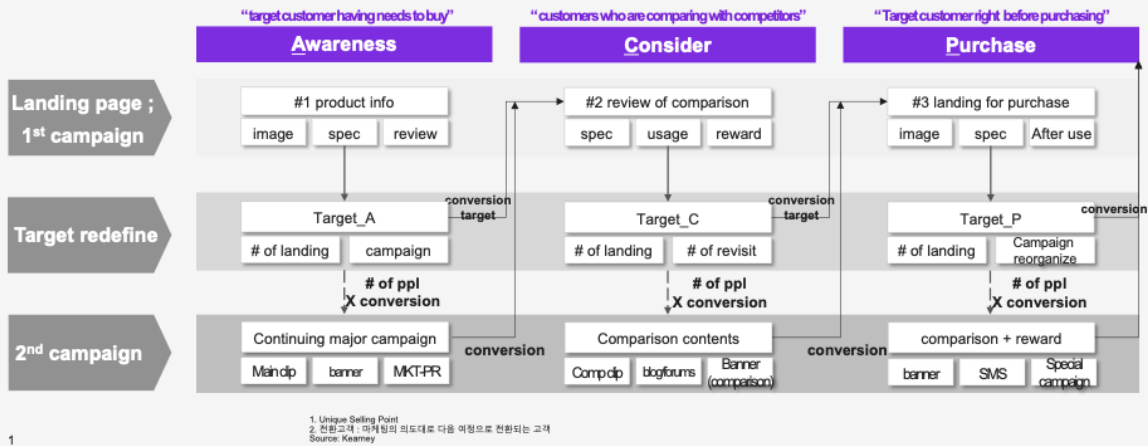

since I am under a NDA with the client, I cannot reveal the exact page of the application and the name of it

These are the slides which summarized the contents that I presented to customers, to revisit their commerce application in the whole level

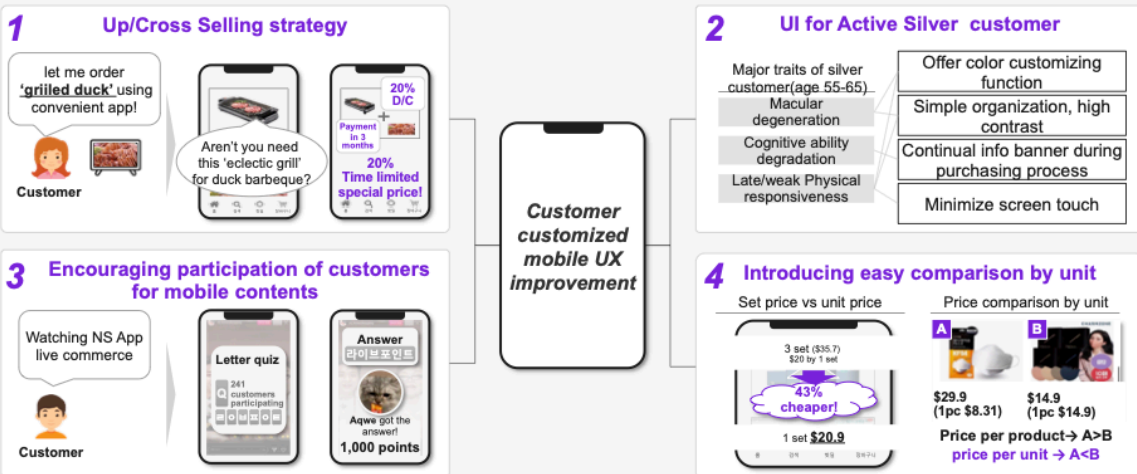

In order to target customers according to their customer journey, customized USP marketing, retargeting and fundamental UI should be ready to maximize the effect

Customer targeting Framework by purchase stage

Customer UI/X (2/2)

Advancing UI for cross-selling, targeting active silver customers, considering a company's mobilization strategy and diversified customer segments

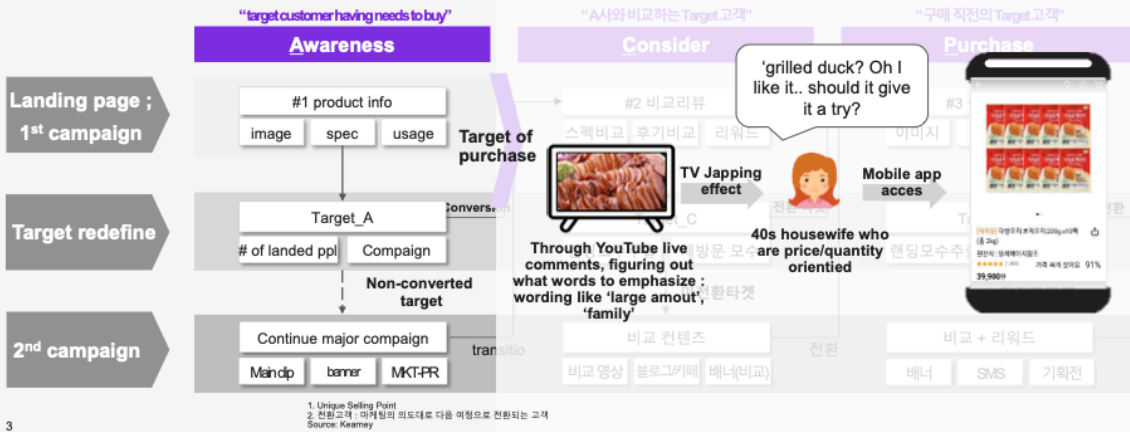

General overview to set up strategies for customized UI

1. To lead cross-selling (for already active customers)

[ideation of customized UI design] initially collect the purchasing, behavior and promotion responsiveness of those who responded to the simple product information for proceeding campaign based on customer USP

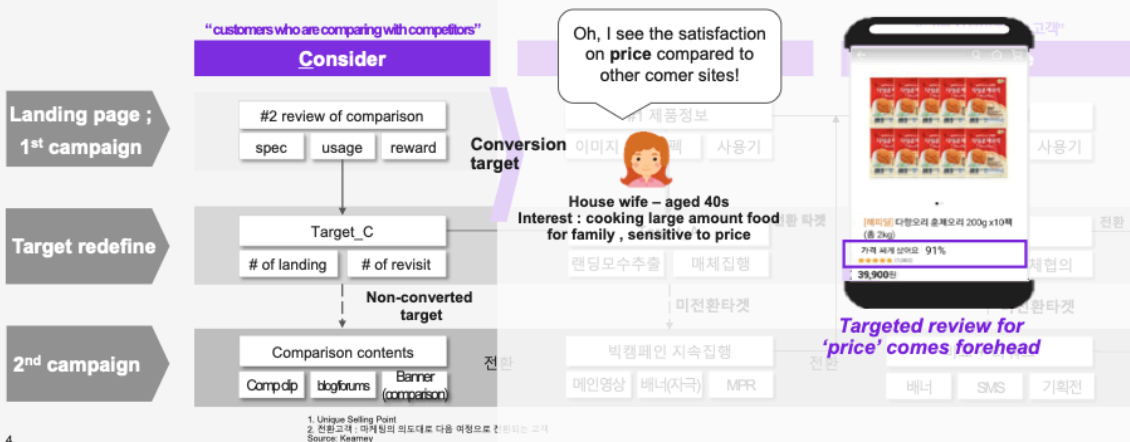

Customer targeting Framework by purchase stage

- To lead the cross selling or to expand the size of sales bucket by customer, it is important to analyze the purchasing behavior

[example of customized UI design] show the sequence of reviews emphasizing 'large amount' and 'pricing' for price-oriented customers to raise the trustworthiness of customized service & platform

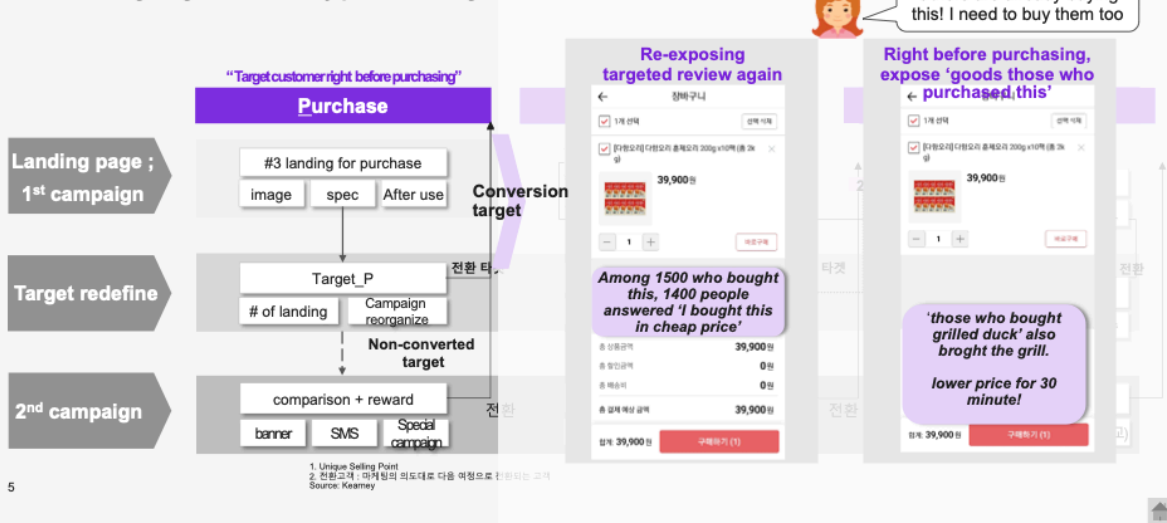

Customer targeting Framework by purchase stage

- If 1st campaign was fail to lead immediate buying of customer, showing targeted review by others is also important to lead the revisit of the page and take a look the product once again

[example of customized UI design] show the review and similar products bought of customers who have similarity with the user to raise the conversion purchasing rate, to increase x- selling rate

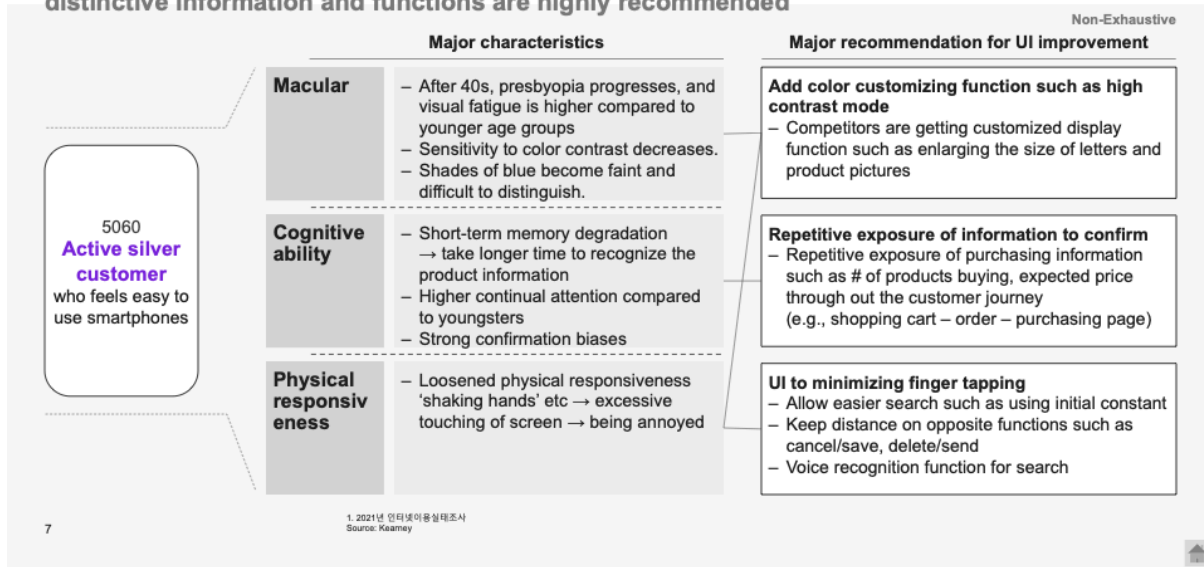

Customer targeting Framework by purchase stage

- Until end of the payment, customers would continuously think about whether they stop purchasing behavior or not. Therefore, continual exposure to the other’s satisfaction and behavior would incentivize customers to proceed buying and other products as well
- By giving them limited time of discounted offer, the client may motivate customers to take a look other related products and lead them to buy the one.

2. Targeting 5060 senior customers (major of the client)

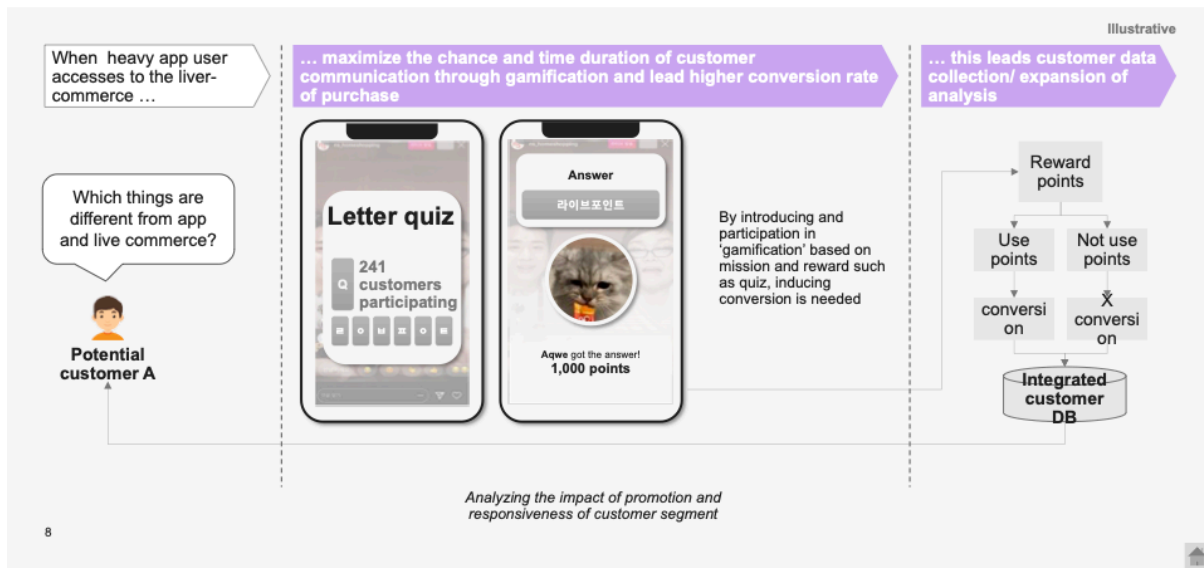

The major customers who aged 5060 are experiencing presbyopia and having comparative difficulties to recognize new information so providing customized UI for emphasizing colors, distinctive information and functions are highly recommended

- based on the customer data and market research including competitor analysis, we've figured out that 5060 customers contribute to the sales the most. Therefore, giving more comfortable and attractive UX should be first and foremost to raise additional sales and strengthen brand loyalty
- Based on their purchasing behavior and demographic trait analysis, we suggested differently designed UI by individual customers

3. Encouraging participation of customers for mobile contents

Introduction of 'Gamification' function inside of liver commerce that allows the active participation of potential

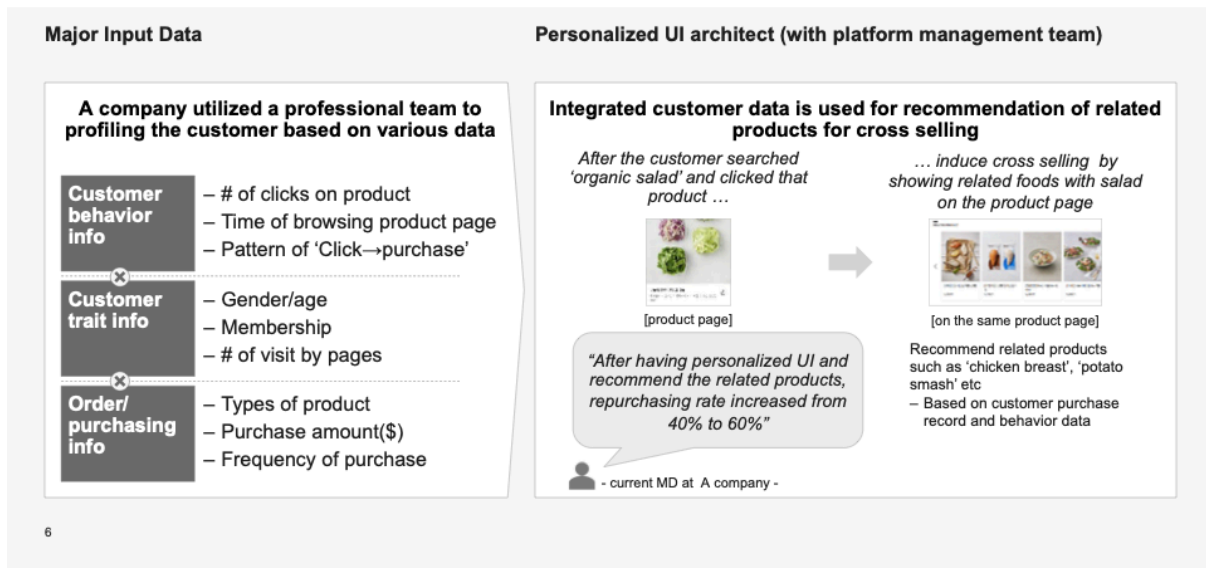

- Those who usually enjoys mobile application want to feel enjoyment through live-commerce. Therefore, leading participation of them would increase the connectedness with the hosts, application and the customer which will be eventually extended to the revisit of purchasing page. Therefore, by one-way live-commerce, we suggested to have more entertaining functions so that more people have more touch point with the medium itself and the product

UX Audit (Benchmark)

Bench mark for team, role, functions and target audience

[comparison with competitors] A company offers customized promotion of related goods to sell based on integrated customer information profiling

we could deliver the importance of repurchase rate

Result

After revision of the application, we've got 4.8/5 on the Google Play. It was 2.8 when we first observe the review of the application users(2021).

comments before the renewal of the app

- "It is such a waste to give this app one star. after so many updates, the application just stopped and push marketing comes out even though I did not agree on that"
- "I am not going to use this application and the TV commerce as well. It's just sucks"

comments after the renewal of the app

- "the page itself gets really cleaned, fast and easy to log-in"
- "I really love the fact that they changed the whole UI of the application. It got much better"

My role

▼ customer segmentation after analyzing customer data

- **record** 를 사용하여 문제를 해결하였습니다.

▼ making seamless UI composition according to ASP process

▼ UX audit to strengthen the rationale of utilization of customer data, benchmark the method of customer behavior analysis, UI customization, segmentation

- **record** 를 사용하여 문제를 해결하였습니다.

Reviewing the project..

Although there were several it was difficult to communicate with both designer and developers since they have long period of conflicts of understanding
