

Cost optimization - building Dashboard

≡ Customer	Food manufacturing company
≡ Done by	high price of imported goods due to COVID-19

Analysis of cost optimization process and the role of dashboard

Dashboard shows the process of optimization and its impact on the whole business

- Since there are various cost factors impacting the business, recategorizing cost levers including raw materials to overhead cost should be first and foremost
- By analyzing big data, figuring out major cost factors which gives fluctuation and financial burden to the business is important

- After analyzing and building a strategy to tackle those major cost factors, I built dashboard to check the progress of the project and communicate with the client
- in this article, I just illustrate the **some of simplified version of dashboard** that I've built for my client not to reveal client's information

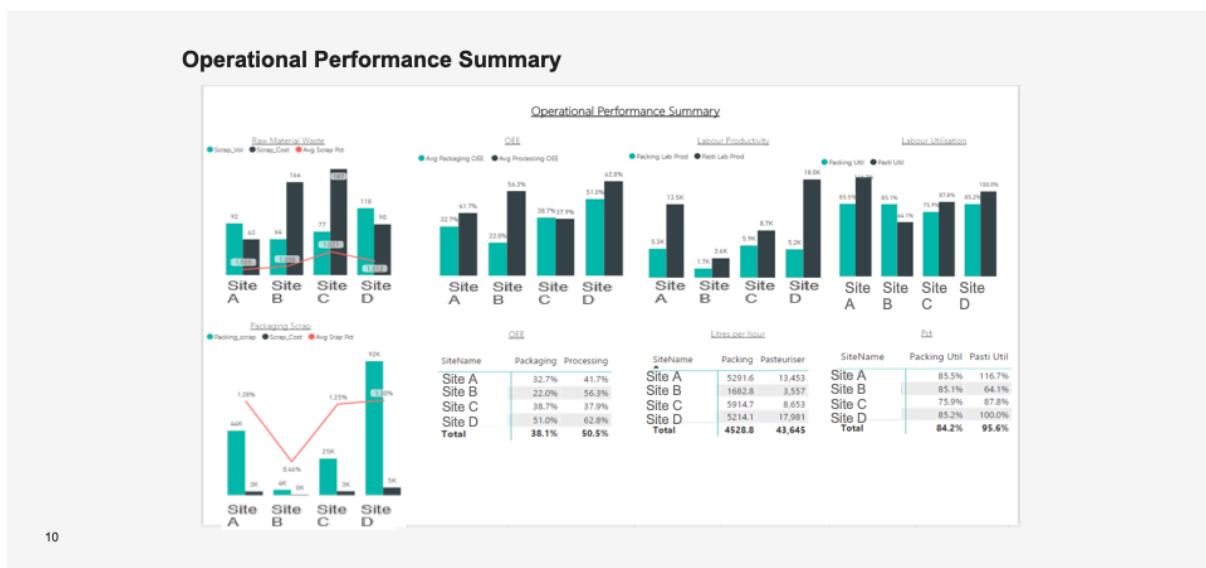

LV0 - Dashboard A : Primary Dashboard

A n-tiered cost dashboard allows users to understand costs of the network and key drivers.

This dashboard illustrate the whole progress of project by factory location. Each graph shows raw material waste, Operational Efficiency, Labor productivity, Labor utilization

By comparing each site, figuring out why and how there are gap among factories should be tackled

Dashboard A : General performance summary
- Operational performance summary page compares sites across key operational metrics

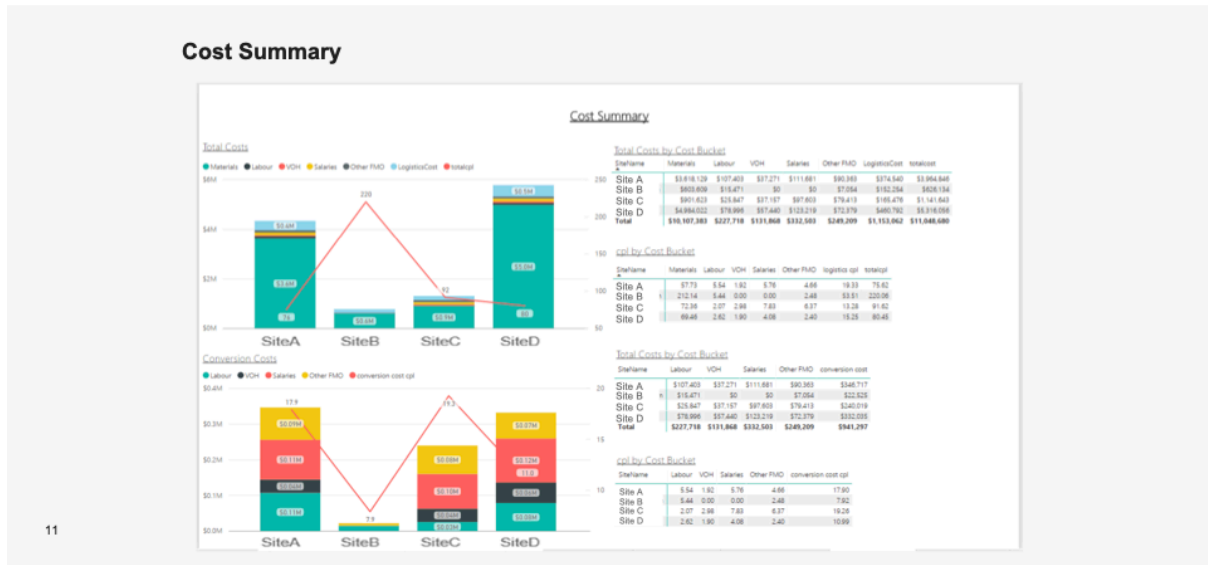

LV1 -Dashboard B : cost summary

This dashboard shows the cost lever by each factories. Although the client is producing the similar product, cost impact may be differed by their productivity and the raw material waste management. Therefore, figuring out major cost

levers, and detailed cost buckets being consists of each cost levers are important.

Dashboard B : A high level cost summary

Showing total cost and cost per unit of major cost buckets across the network

Since the client have not gathered all the data although it was being accumulated on their SAP, this dashboard attribute to the project hugely due to the fact that managers became easy to compare and concentrate each factories producing status in real time.

Skill-sets to

✓ Language

- Python

⚙️ Infra

- Excel, Power BI

My role

▼ recategorizing cost drivers especially for the raw materials in regard to Bills of Materials(BOM)

- **record** 를 사용하여 문제를 해결하였습니다.

▼ internal and external interview to understand the size of cost buckets and recent trend of it so that

▼ UX audit to strengthen the rationale of utilization of customer data, benchmark the method of database architecture

- **record** 를 사용하여 문제를 해결하였습니다.

Architecture

Reviewing the project..

Although there were several missing data, we could successfully forecasted the hike of procurement price and suggest customized recipe, change of suppliers, material, and buying formula using various machine learning models in analysis including Decision Tree, Random Forests and so on.

The CEO was so satisfied to see the impact of strategic buying and its application to the manufacturing dashboard

Dashboard B : A high level cost summary

Showing total cost and cost per unit of major cost buckets across the network
